

Weekly Executive Summary Dashboard

How to Use Your Dashboard — Quick Start Guide

What This Does For You

This dashboard takes your raw sales data and turns it into a full business performance report in seconds. No formulas. No pivot tables. No analyst needed.

Upload your file → the dashboard automatically calculates:

- How your sales compare to the same period last year
 - Which products are growing and which are declining
 - How fast each product is selling off the shelf
 - Each product's share of your total revenue
 - A formatted Excel report you can save and share
-

Before You Upload — Getting Your File Ready

This is the most important step. The dashboard needs your data in a specific format. The good news: if you can export a sales report from your system, you're 90% of the way there.

What Your File Needs to Look Like

Your file needs **four columns** — one row per product per day:

Date	Item Name	Sales Revenue	Units Sold
2024-01-15	Organic Granola Bar	174.50	50
2024-01-15	Sparkling Water 12pk	89.90	10
2024-01-16	Organic Granola Bar	122.15	35
2024-01-16	Trail Mix 8oz	59.90	10

That's it. Four columns, one product per row, one day per row.

Common Mistakes to Avoid

Here is what a typical spreadsheet looks like vs. what the dashboard needs:

What most business owners start with (won't work):

	A	B	C	D
1	WEEKLY SALES REPORT — JANUARY 2024			
2				
3	Product	Week 1	Week 2	Total
4	Granola Bar	\$450	\$380	\$830
5	Sparkling Water	\$200	\$310	\$510
6	TOTAL	\$650	\$690	\$1,340

Problems with this format: merged title row, weekly columns instead of daily rows, dollar signs in the cells, a Total row mixed in with the data.

What the dashboard needs (works perfectly):

Date	Item Name	Sales Revenue	Units Sold
2024-01-01	Granola Bar	64.29	18
2024-01-01	Sparkling Water	35.96	4
2024-01-02	Granola Bar	50.05	14
2024-01-02	Sparkling Water	62.93	7

Clean column headers, one row per product per day, plain numbers (no \$ signs in the cells).

How to Export From Common Systems

Square Go to Reports → Sales Summary → Export. Choose CSV. You may need to reformat the columns to match the four required names.

Shopify Go to Analytics → Reports → Sales by Product. Export as CSV. The export will have more columns than you need — just keep Date, Product Title, Net Sales, and Quantity and rename them.

QuickBooks Go to Reports → Sales by Product/Service Detail. Export to Excel. Clean up the header rows and rename the columns to match.

Excel or Google Sheets (manual tracking) If you track sales manually, make sure your sheet follows the format above — one row per product per day, no merged cells, no subtotal rows mixed in.

Tip: The dashboard is flexible with column names. "Revenue", "Sales", and "Amount" all work in place of "Sales Revenue". "Units", "Qty", and "Quantity" all work in place of "Units Sold". If you get an error, just rename your columns to exactly: `Date` , `Item Name` , `Sales Revenue` , `Units Sold` .

How Much Data Do You Need?

- **Two or more years** — ideal. You'll get full Current Year vs. Last Year comparisons across all five timeframes.
 - **One year** — works fine. The Last Year columns will show \$0 for periods without history, but all Current Year metrics calculate correctly.
 - **Less than a year** — still useful for the shorter timeframes (Latest Week, Latest 4 Weeks).
-

Uploading Your File

1. Open the dashboard link in any browser (Chrome, Safari, or Firefox)
2. In the left sidebar, click the **upload box**
3. Select your `.csv` or `.xlsx` file
4. The dashboard fills in automatically — no button to click

Don't have your data ready yet? Click "No data yet? Download a sample" in the sidebar to download a test file and see the dashboard in action.

Reading Your Dashboard

The Info Bar

Four quick facts at the top of the page:

- **Latest Date in File** — all time windows are calculated from this date, not today's date
- **Earliest Date** — how far back your data goes
- **Unique Products** — how many distinct items the dashboard found
- **All-Time Revenue** — your total revenue across the full dataset

The Export Button

Click **"Export Full Report to Excel"** to download a fully formatted Excel workbook with 6 sheets — one overview sheet and one detailed sheet per timeframe. Great for sharing with a business partner, accountant, or investor.

Master Business Summary

A quick snapshot of your entire business across all five time windows at once. Use this every week as your first stop — it tells you immediately whether you're up or down vs. last year at every horizon.

The five timeframes covered:

Timeframe	What it covers
Latest Week	The last 7 days
Latest 4 Weeks	The last 28 days (roughly one month)
Latest 13 Weeks	The last 91 days (roughly one quarter)
Latest 52 Weeks	The last 364 days (roughly one year)
Year to Date	January 1st of this year through your latest date

Item Detail Tabs

Click any tab to see your five timeframes broken down **by individual product**. Products are ranked from highest to lowest revenue by default. Click any column header to re-sort.

What Each Column Means

CY Revenue / LY Revenue Your total dollar sales for that product in the current year window (CY) and the same window last year (LY).

YoY Rev % (Year-Over-Year Revenue Percent) How much your revenue changed compared to last year:

- ▲ **Green** = grew vs. last year — great news
- ▼ **Red** = declined vs. last year — worth your attention
- ● **Yellow** = flat, within $\pm 0.5\%$ either way
- = no last year data available

% of Total (CY) This product's share of your total revenue for that timeframe. All products add up to 100%. Tells you which items are actually driving your business vs. which are secondary.

Example: If Granola Bars made \$1,500 out of your \$10,000 total, their % of Total is 15.0%.

Velocity (u/wk) Units sold per week. This is your most practical inventory metric — it tells you exactly how fast a product moves regardless of how long the time window is.

Example: A product that sold 520 units over 13 weeks has a velocity of 40 units/week. You know you need roughly 40 units per week to avoid going out of stock.

Charts Section

At the bottom of the dashboard, three charts update automatically with your data:

1. **Revenue: CY vs LY by Timeframe** — a side-by-side bar chart showing how your overall revenue compares to last year across all five windows
2. **CY Revenue by Item** — a horizontal bar chart showing which products generated the most revenue in your selected timeframe
3. **YoY % by Item** — a horizontal bar chart showing which products grew and which declined, color-coded green and red

Use the dropdown above the item charts to switch between timeframes.

Troubleshooting

"Could not read the file" or "Missing column" error Rename your columns to exactly: `Date`, `Item Name`, `Sales Revenue`, `Units Sold` — then re-upload.

Last Year columns show \$0 Your file doesn't go back far enough for that time window. This is normal if you have less than a year of data.

Numbers look way too high or too low Make sure `Sales Revenue` contains the total dollar amount for that row (units × price), not just the unit price and not a running total.

The latest date looks wrong Check your file for any stray future dates or data entry errors — the dashboard uses the most recent date it finds to anchor all time windows.

Export button doesn't download Try a different browser. Chrome works most reliably.
